

O-Brain — Your AI's Memory Notebook

O-Brain — Your AI's Memory Notebook 🧠

A **100% local** tool that **automatically remembers** the important decisions, rules, and preferences from your Claude Code conversations, and shows them as a **knowledge graph & timeline**.

In one line: AI is smart but forgets everything once a chat ends — like a *brilliant friend with amnesia*. O-Brain is the **auto-notepad** you keep next to that friend: it writes down what matters and reminds the AI next time.

What does it do?

- **Auto-save:** when a Claude Code session ends, it automatically records **decisions, promises, constraints** (e.g., "use port 7740 for this project") — no manual work.
- **Auto-redaction (security):** passwords / API keys are **automatically masked** before saving ([REDACTED]).
- **See it as a graph:** browse memories as **dots & lines** (2D/3D graph) — **the graph is the start screen**. Also a **list** and a **timeline**.
- **Overview at a glance:** total count, distribution by type/topic/**project**, most-connected memories, and most-viewed — all on one screen (**Overview** tab).
- **Connect memories:** link them by relation — "this decision **supersedes / supports / influences / contradicts** that" — and see colored edges in the graph.
- **Auto-categorize by topic:** memories are auto-grouped into topics (security, UI, deploy, ...); toggle "**분류색**" (**category colors**) in the graph to color nodes by topic.
- **Comfortable browsing:** search, type/**project** filters, sort, **light/dark theme**, **edit a memory**, export (JSON/Markdown), delete. ⌘K (**Ctrl+K**) for quick search/navigation anywhere.
- **The AI actually uses it:** new sessions auto-load relevant memories (recent & high-confidence first), and during a chat the AI can **search, trace relations, and view how**

decisions evolved.

- **Automatic project tagging:** each memory is auto-tagged with **the project whose files you actually edited in that session** (no matter where you launched Claude Code — it uses the project you touched most).
 - **Auto-refresh:** new memories show up **on their own** (when you return to the tab or after a short wait); the top-right **refresh (↺) button** updates instantly too.
 - **100% local:** everything stays on your PC. Nothing leaves over the internet.
-

1. Prerequisites

- Windows PC
- **Node.js** (LTS) — if missing, install from nodejs.org and **open a new window**
- **Claude Code**
- Internet (only for installing)

2. Install (just 2 steps)

Type both into the **Claude Code input box**.

① Register the marketplace

```
/plugin marketplace add D:\AI_Dev_Work\2026y\26y_06m_21d_O-Brain\plugin
```

② Install

```
/plugin install o-brain@o-brain-local
```

→ Then **restart Claude Code**. Done.

`o-brain` = plugin name, `o-brain-local` = marketplace name. If ① is blocked because it's "not a git repo", run `git init && git add -A && git commit -m init` in that folder and retry.

3. Check it installed

In the Claude Code input box: - `/o-brain:status` → see memories & status - `/o-brain:selftest` → one-shot brain check (save / security / search).    means OK.

4. How to use (easiest part)

1. Chat as usual; to make it remember something, say a **clear decision sentence**. e.g., `Let's set this project's test port to 7740` (Plain commands like `cd` or small talk are NOT saved — only “decide / use / forbid”-type sentences.)
2. **End the chat**: type `/clear` (or close the window). → saved at this moment.
3. Verify: `/o-brain:status` → the **memory count grows** and your sentence appears.

5. See the dashboard

Easiest way — in the Claude Code input box:

```
/o-brain:open
```

→ Starts the server if it's off and opens the dashboard in your browser. (Or tell Claude “open the screen”; manually: `! cd D:\AI_Dev_Work\2026y\26y_06m_21d_0-Brain\app; npm start` then open `http://127.0.0.1:7740/`.)

What you can do on screen: - Switch **Graph (start screen)** · **Overview** · **List** · **Timeline**. Search at the top (press `/` to jump), **⌘K (Ctrl+K)** for quick command/memory search, click an item for details. - **Overview** tab: total count, distribution by type/topic/**project**, most-connected and most-viewed memories. Click “**connected-less memories**” to see only the orphans in the graph. - In the detail panel: **copy** · **edit (content/type/importance)** · **delete**, and under “**this memory's relations**” link it to others (supersede/support/influence/contradict). (Secrets are auto-redacted again on edit.) - Top-right **refresh (↻)** · **light/dark theme** · **export** (JSON/Markdown), type/**project filter** · **sort**. (New memories auto-appear after a short wait / on tab return; projects are listed by most-recent activity.) - Hover a graph node to highlight its connections; search highlights matching nodes. Use the “**분류색**”(category) button to recolor nodes by type ↔ topic. - Filter by **importance/period**, focus a memory's **neighborhood** (target **◎** button in detail), and frequently-opened memories **glow brighter** (view count). As memories grow, the graph shows the **most important ones first** and tells you “top M of N”.

6. Backup & restore (protect your memories)

- **Backup:** `/o-brain:backup` (or `npm run backup`). Also auto-runs when the server starts.
 - Location: `D:\AI_Dev_Work\2026y\26y_06m_21d_0-Brain\app\data\backup\` (keeps the latest 7)
- **Restore:** copy the most recent `obrain-....db` from `backup\` over `app\data\obrain.db`. (Copy the current file elsewhere first.)

7. Commands at a glance

What	Where	Command
Install ①	Claude Code	<code>/plugin marketplace add</code> <code>D:\AI_Dev_Work\2026y\26y_06m_21d_0-Brain\plugin</code>
Install ②	Claude Code	<code>/plugin install o-brain@o-brain-local</code>
Status	Claude Code	<code>/o-brain:status</code>
Self-test	Claude Code	<code>/o-brain:selftest</code>
Backup	Claude Code	<code>/o-brain:backup</code>
Open dashboard (auto, recommended)	Claude Code	<code>/o-brain:open</code>
Open screen (manual)	Terminal	<code>cd</code> <code>D:\AI_Dev_Work\2026y\26y_06m_21d_0-Brain\app</code> → <code>npm start</code>
Screen URL	Browser	<code>http://127.0.0.1:7740/</code>

8. File & data locations (absolute paths)

- Memory DB: `D:\AI_Dev_Work\2026y\26y_06m_21d_0-Brain\app\data\obrain.db`
- Backups: `...\app\data\backup\`
- Settings: `...\app\.env.local` (sample: `.env.local.example`)

8-1. Environment variables (optional · `app\.env.local`)

Defaults are fine for most users. To change, copy `.env.local.example` to `.env.local` and edit. (`.env.local` must never be committed — already blocked.)

Variable	Default	Description
<code>OBRAIN_PORT</code>	<code>7740</code>	Dashboard port (<code>http://127.0.0.1:<port></code>)
<code>OBRAIN_DATA_DIR</code>	<code>./data</code>	Folder for the memory DB & backups
<code>OBRAIN_EXTRACT_MODE</code>	<code>rule</code>	Extraction mode. Currently runs rule-based (free, local) . <code>ai</code> (Haiku) mode is next — needs <code>ANTHROPIC_API_KEY</code> when enabled
<code>OBRAIN_VEC_GATE</code>	<code>0.92</code>	Search relevance threshold (lower = stricter)

8-2. Folder structure (at a glance)

```
O-Brain/
├─ app/           Local app (server•DB•search•web dashboard)
│  ├─ src/        Code (.mjs)
│  ├─ web/        Dashboard UI (index.html)
│  └─ data/       Memory DB & backups (personal data – not committed)
├─ plugin/       Claude Code plugin (hooks•MCP•slash commands)
├─ README.md • README.en.md • GUIDE.* (docs)
└─ LICENSE
```

8-3. Build · test · deploy (install)

- **Build:** none (vanilla — the web UI runs with no build step). Just `cd app && npm install` once for dependencies.
 - **Test:** `/o-brain:selftest` (or `cd app && npm run selftest`) →    means OK.
 - **Deploy (install):** like **2. Install** — `/plugin marketplace add` → `/plugin install` in Claude Code. No cloud deploy (100% local).
-

9. Troubleshooting (things we actually hit)

Symptom	Cause	Fix
Marketplace not found	Tried to install in one step	Use the 2 steps (register → install)
Nothing gets saved	No "decision" sentence / session not ended	Say a clear decision sentence, then /clear
Screen (URL) won't open	Server not running / port in use	Run <code>npm start</code> again, or change <code>OBRAIN_PORT</code> in <code>.env.local</code>
Wrong port answer in a new chat	Conflict with other memory tools (see limits)	Known limit — use <code>search_memory</code> directly
'node' is not recognized	Node.js not installed	Install LTS from nodejs.org → new window
3D graph won't show	No WebGL / low-spec	Switch to 2D
New memory/project not visible	Screen is stale	Click the refresh (↻) button (or wait — it auto-refreshes)
Projects collapsed into one	Old memories used the old rule (launch folder)	From the next /clear , memories auto-tag the project you actually worked in (old ones stay as-is)
Install refused (not a git repo)	Local folder	In <code>plugin</code> folder: <code>git init && git add -A && git commit -m init</code>

10. Safety & privacy

- Runs **entirely on your PC**. Memories never leave over the internet.
- Secrets (passwords/keys) are **auto-masked** before being stored.
- Data lives only in the folder above — **back it up yourself** (avoid cloud-synced folders).

11. License & warranty

- License: **Apache License 2.0** © 2026 SoDam AI Studio (full text in [LICENSE](#)).
- **No warranty (AS-IS)**: provided as is; you are responsible for outcomes.
- Bundled open source (better-sqlite3, sqlite-vec, transformers.js, force-graph, express, ...) is under **their own licenses** (MIT/Apache, etc.).
- If O-Brain uses Claude for extraction, **Anthropic's terms apply separately**.

12. Honest limitations (current v0.1)

- **Read-back conflict**: other memory tools on the same PC (memory-bank plugin · persona MEMORY.md) may mix in old/conflicting facts, so O-Brain's latest memory can get buried. (improvement planned)
- **Rule-based extraction**: catches clear decision sentences well, but may miss subtle context. (AI/Haiku mode is next)
- **Manual memory relations**: you link them by hand for now. Automatic AI suggestions are next (kept manual on purpose, to avoid misleading auto-relations).

Written from verified, working values (not guesses). If something breaks, share the exact screen and we'll fix it together.
